This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                  1024
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GSS 10-DEC-2001

                     melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP brosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

/note="Vector: pHOS1; Site_1: BET I; Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond, LiS.
C.G., and Diamond, LiS. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (~2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gsoegawa and mannoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCT.98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library or filters for hybridization from the BACPRC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

/note="Wector: pHOS1; Site 1: Bet I; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of B. histolytica using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entemocha histolytica: a method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

/clone lib="plasmodium falciparum ib7 asexual cDNA"
/clone library was constructed by Debopam Chakrabarti.
Xhof; Library was constructed by Debopam Chakrabarti.
Total RNA samples were isolated from mixed stage
saponin(0.1%)-lysed P. falciparum ib7 infected
erythrocytes by the acidic guanidinlum-phenol chloroform
method. The poly A+ RNA was isolated by the polyAT-Tract
mRNA isolation system (Fromega, WI) using streptavidin
Magnesphere particles. Directional cDNA libraries were
constructed by oligo d(T) priming of poly(A) + RNA (5mg)
into BockI and XhoI sites of I zapiI vector using the Zap
cDNA synthesis kit (Stragene, CA). The average size of the
cDNA inserts in the library was between 1.0 and 1.5kb.
Clones were mass excised using the ExAssist helper phage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bU498120

isolated nucleic acid for use in diagnosing Staphylococcus infections in vaccines for eliciting immune responses to the infections.
                                                                                                                                                                                                                                                                                                                                                  UDP-N-acetylmuramate:L-alanine ligase; MurC; immunogen; vaccine; antibody; wound infection; cellulitis; burn infection; eyelid infection; food poisoning; joint infection; neonatal conjunctivitis; osteomyelitis; skin infection; scalded skin syndrome; toxic epidermal necrosis; Ritter's disease; Lyell's disease; toxic shock syndrome; endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence represents S. aureus Murc (UDP-N-acetylmuramate:L-alanine ligase). The polynucleotides of the invention are used to detect Staphylococcus nucleic acids in a biological sample from an animal for diagnosing Staphylococcus infections. The polypeptides of the invention
                                                                                                                                                                                                                                                                                                                              S. aureus UDP-N-acetylmuramate:L-alanine ligase, MurC.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ALIGNMENTS

from an animal to diagnose Staphylococcus infections. The polypeptides are also used in vaccines to elicit protective antibodies in an animal to a member of the Staphylococcus genue and for preventing or attenuating an infection caused by a member of the Staphylococcus genus e.g wound infection, cellulitis, burn infection, eyelid infection, food poisoning, joint infection, meonatal conjunctivitis, osteomyelitis, skin infection, escaled skin syndrome (also known as toxic epidermal necrosis, Ritter's disease and izyell's disease), toxic shock syndrome and endocarditis. The polymucleotides may also be used in vaccines and for preventing or attenuating a Staphylococcus infection. Antibodies to the polypeptides may be used to purify, detect and target the polypeptides in in vitro and in vivo diagnostic and therapeutic methods
used to detect anti-Staphylococcus antibodies in a biological sample

for

The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention

Sequence 444 AA;

New Staphylococcus aureus protein, useful as a vaccine for treating or preventing Staphylococcal infection, specifically an infection caused by S. aureus, e.g. sepsis.

2003-468119/44. N-PSDB; ADD15464. Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

Claim 20; SEQ ID NO 30; 325pp; English.

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus pneumoniae (S. pneumoniae) and Escherichia coli (E. coli) that provide novel antimorobial targets. Specifically, it refers to polypeptides that are involved in membrane biosynthesis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the characteribes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also functional the side of the control of these proteins that facilitate function describes not the structural and functional developing antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating food products to eliminate potential pathogens. This polypeptide sequence is the MurC protein encoded by experimentally predicted DNA from S. aureus UDP-N-acetylmuramate-alanine ligase of the invention. information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for

N-PSDB; ADD15462. THE CONTRACTOR OF THE STATE OF

Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in

membrane biosynthesis, useful as targets for pathogenic bacteria.

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus),

Streptococcus pneumoniae (S. pneumoniae) and Escherichia coli (E. coli)

that provide novel antimicrobial targets. Specifically, it refers to polypeptides that are involved in membrane biosynthesis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also fusion proteins. These proteins provide structural and functional information to aid the discovery of therapeutic molecules to treat discorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for an antigen for vaccination purposes. developing antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating food products to eliminate potential pathogens. This polypeptide sequence is the MurC protein encoded by DNA predicted from the genomic sequence of S. aureus UDP-N-acetylmuramate-alanine ligase of the invention. screening New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 43780; 1766pp; English.

the nucleic acid inhibits proliferation of a cell. Also included are:

the folls antisense sequences given in the specification where expression

of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid

encoding a polypeptide whose expression is inhibited by the antisense

concleic acid; (2) a host cell containing the vector; (3) an isolated

polypeptide or its fragment whose expression is inhibited by the

conjugate acid; (4) an antibody capable of specifically binding

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

confounds activity of a gene in an operon required for

proliferation; (7) identifying a compound that influences the activity of

the gene product or that has an activity against a biological pathway

crequired for proliferation; or that inhibits cellular proliferation; (8)

identifying a gene required for cellular proliferation of the biological

corpounds acityity; (11) aculture comprising strains in which the gene

compounds acityity; (11) aculture comprising strains in which the gene

compounds acityity; (11) aculture comprising strains in which the each of the strains is present in a culture or collection of

compounds; or (13) identifying the target of a compound that inhibits the

conjounts; or (13) identifying the target of a compound that inhibits the

creativity; of the strains is present in a culture or collection of

conjounts; or (13) identifying the target of a compound that inhibits or

creativity and organism. The antisense muleic acids are useful for

conditieration of an organism. The antisense muleic acids are useful for

for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at invention relates to an isolated nucleic acid comprising any one of ftp.wipo.int/pub/published_pct_sequences

ŏ New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids.

prokaryotic cellular proliferation protein; antibiotic;

antibacterial; drug design

Antisense;

Staphylococcus aureus.

WO200170955-A2

27-SEP-2001

Example 3; SEQ ID NO 5297; 511pp; English.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes

development. The antisence nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antishodies capable of binding to the expressed proteins, and to obtain antishodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in eflectronic format directly from WIPO at ö themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococous aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic 120 120 180 240 360 360 180 240 300 420 420 TAFDVYVDGBFYDHFLSPQYGDHTVLNALAVIAISYLBKLDVTNIKEALETFGGVKRRFN 300 9 9 HVMNGDKKTSFLIGDGTGMGLPESDYFAFEACEYRRHFLSYKPDYAIMTNIDFDHPDYFK 121 HVMNGDKKTSFLIGDGTGMGLPESDYFAFEACEYRRHFLSYKPDYAIMTNIDFDHPDYFK 1 MTHYHFVGIKGSGMSSLAQIMHDLGHEVQGSDIENYVFTEVALRNKGIKILPFDANNIKE 1 MTHYHFVGIKGSGMSSLAQIMHDLGHEVQGSDIENYVFTEVALRNKGIKILPFGANNIKE DMVVIQGNAFASSHEEIVRAHQLKLDVVSYNDFLGQIIDQYTSVAVTGAHGKTSTTGLLS DMVVIQGNAFASSHEEIVRAHQLKLDVVSYNDFLGQIIDQYTSVAVTGAHGKTSTTGLLS 181 DINDVFDAFQEMAHNVKKGIIAWGDDEHLRKIEADVPIYYYGFKDSDDIYAQNIQITDKG TAFDVYVDGEFYDHFLSPQYGDHTVLNALAVIAISYLEKL,DVTNIKEALETFGGVKRRFN **ETTIANQVIVDDYAHHPREISATIETARKKYPHKEVVAVPQPHTFSRTQAFLNEFAESLS ETTIANQVIVDDYAHHPREISATIETARKKYPHKBVVAVFQPHTFSRTQAFLNEFAESLS** DINDVFDAFQEMAHNVKKGIIAWGDDEHLRKIEADVPIYYYGFKDSDDIYAQNIQITDKG KADRVFLCEI FGSIRENTGALTIQDLIDKI EGASLINBDSINVLEQFDNAVILFMGAGDI Gарв .; 0 Length 437; Staphylococcus aureus cellular proliferation protein #870. The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes theorem to their use in the discovery of novel antibiotics, the essential genes consisted in the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aurens, Salmonalla typhi, Klebbiela pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense mucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins con the compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present saquence represents an essential prokaryotic colorganisms. The present saquence represents an essential prokaryotic colorganisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the proposation of the proposa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DINDVFDAFOEMAHNVKKGIIAWGDDEHLRKIEADVPIYYYGFKDSDDIYAQNIQITDKG 240

The present sequence represents a UDP-N-acetylmuramate:L-alanine ligase

(Murc polypeptide) encoded by the S. aureus Murc gene. Host cells

containing an expression system comprising the Murc gene can be used for

the recombinant production of the polypeptide. Agonists or the Murc

copyreptide are used to treat conditions requiring increased activity or

expression of the polypeptide. Antagonists, inhibitory nucleic acid or

competitive polypeptide are useful for inhibiting the polypeptide e.g.

Competitive polypeptide are useful for inhibiting the polypeptide e.g.

Competitive polypeptide are useful for inhibiting the polypeptide e.g.

Competitive polypeptide are useful for inhibiting they are also useful against

Competitial agents are useful to treat in-dwelling devices for

infection prevention or generally as wound treatments to prevent adhesion

of bacteria to matrix proteins. The Murc polypeptide is also useful for

diagnosing or prognosing a (susceptibility to) disease, for raising

contibodies, to identify modulators or specific receptors; in rational

drug design and as an immunogen for vaccines. The Murc gene sequences are

contibodies and in antisense/ribozyme therapeutics; to detect mutant Murc gene;

contibodies are contibodies and supping; to determine bacterial serotype; and for genetic
New isolated MurC polypeptide from Staphylococcus aureus and related nucleic acid - useful in diagnosis, treatment and prevention of bacterial

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections,

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway concerning a gene product or that has an activity against a biological pathway of required for proliferation or the the test compound that inhibits ending retaining the pathway in which a proliferation or the broliferation or the brological pathway in which a proliferation required gene or its gene product lies or agene on which the test compound that inhibits apoliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism. The activity; (11) a culture comprising strains in which the gene product is overaxpressed or underexpressed; (12) determining the extent to broliferation of an organism. The antisense nucleic acids required for proliferation for an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, X. premuoniae or P. aeruginosa. The present sequence is encoded by one of the target proxaryoric essential genes world. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequences.
                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                123

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify.

proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous of organisms. The present sequence for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences

screening New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs. New antisense nucleic acids, for homologous nucleic acids

Claim 25; SEQ ID NO 57651; 1766pp; English

the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter peperably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
encoding a polypeptide whose expression is inhibited by the antisense
comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
compression is inhibited by the antisense uncleic acid; (4) an antibody capable of specifically binding
the polypeptide (5) producing the polypeptide; (6) inhibiting cellular
compression or the activity of a gene in an operon required for
proliferation or that an antibody against a biological pathway
compounds agene required for cellular proliferation of the gene product lies
cor a gene on which the test compound that inhibits proliferation of an
compound's activity; (1) a culture comprising strains in which the gene
cor or a gene on which the test compound that inhibits in which the extent
compound's activity; (1) a culture comprising strains in which the extent
compound's activity; (1) a culture comprising strains in which the gene
cor or agene on which the test compound that inhibits the
compound's activity; (1) a culture comprising strains in which the
compound's activity; (1) a culture comprising strains in which the
compound is activity; (1) a culture comprising are useful for
compounds; or (13) identifying the target of a compound that inhibits the
compounds or screening for homologous nucleic acids required
cor dentifying proteins or screening for homologous nucleic acids required
cor dentifying proteins or screening for product milerational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumonnae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained The invention relates to an isolated nucleic acid comprising any one of n electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present invention Proteins expressed from the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific artipodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 2712.7. Application US/09540236

Patent No. 6673910

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATAI TITLE OF INVENTION: ROR DIAGANSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2005-001
CURRENT APPLICATION NUMBER: US/09/540,236
UNRENT FILING DATE: 2000-04-04
NUMBER OF SEQ ID NOS: 3840

SEQ ID NO 2712
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13;

US-09-328-352-5023
Sequence 5023, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION UNMERR: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             122 VMNGDK-KTSFLIG-----DGTGMGLPESDYFAPEACEYRRHPLSYKPDYAIMTNIDFDH 175

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
           Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/489, 039A
CURRENT FILING DATE: 2000-01-27
PRIOR PILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
SEQ ID NO 12280
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INCORNATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 978, Application US/09198452A
Batent No. 65529294
GENERAL INFORMATION:
APPLICANT: Griffale, R.
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve
TITLE OF INVENTION: and treatment of infection
TITLE OF INVENTION: and treatment of infection
CURRENT APPLICATION NUMBER: US/09/199,452A
